

ASP.NET Core

AN OVERVIEW OF BUILT IN MIDDLEWARE

By Achyut V. Kendre

Today's Learning.

- Built in Middleware's.
- Static Files Middleware
- Welcome Page Middleware.
- Default files Middleware.
- File Server Middleware.
- Directory Browser Middleware.

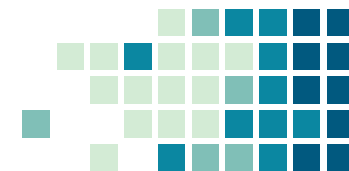

Built in Middleware's

- ASP. Net Core provides many built in middleware's to configure the request pipe line.
- Order of the middleware is important while injecting the middleware in request pipe line.
- For built in middleware, IApplicationBuilder provides you extensions method those can be used to inject the build in middleware's in request pipeline.

Few Built in Middleware's

Middleware	Description
<u>Authentication</u>	Provides authentication support.
<u>Authorization</u>	Provides authorization support.
<u>CORS</u>	Configures Cross-Origin Resource Sharing.
<u>DeveloperExceptionPage</u>	Generates a page with error information that is intended for use only in the Development environment.
<u>HTTP Logging</u>	Logs HTTP Requests and Responses.
<u>HTTPS Redirection</u>	Redirect all HTTP requests to HTTPS.
<u>MVC</u>	Processes requests with MVC/Razor Pages.
<u>Session</u>	Provides support for managing user sessions.

Few Built in Middleware's

Middleware	Description
<u>Static Files</u>	Provides support for serving static files and directory browsing.
<u>Welcome Page</u>	Allow you to display default page when you run application.
<u>File Server</u>	This middleware is combination of Welcome Page and Static Files.
<u>Directory Browsing</u>	Enables you Directory Browsing in ASP.Net Core Application.
<u>Routing Middleware</u>	Enables you to register Routing in ASP. NET Core Application.

Static Files Middleware

- Static Files are those files those will not be processed by server will be returned directly to browser by web server when requested, web browser will process it.
- Few Static Files are – Html, CSS, JS, Images etc.
- By default ASP.NET Core Application Does not server Static Files.

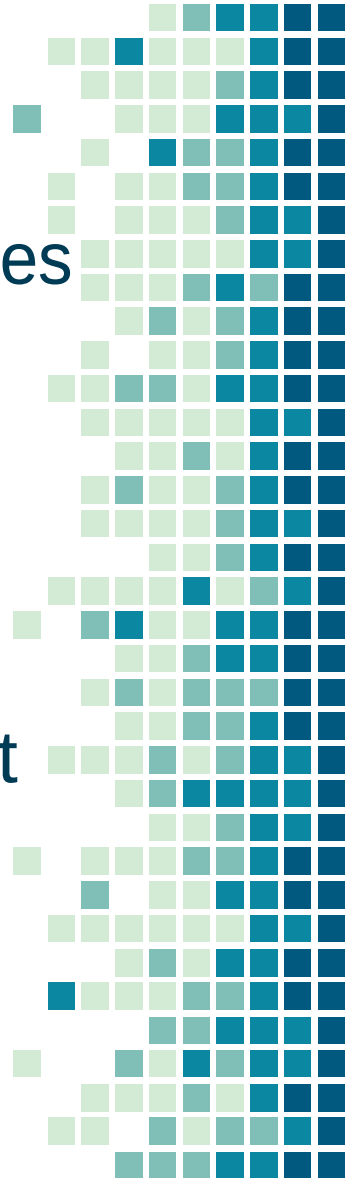

Static Files Middleware

- To Enable ASP.NET Core Application to Serve Static Files we need to inject StaticFiles Middleware in Request Pipe line using UseStaticFiles Middleware Extension Method.
- Only static files from the wwwroot folder can be served by Static Files Middleware.
- You can create separate sub folders under wwwroot for files like css, js etc as per your requirements.

Welcome Page Middleware

- By default when you run ASP.NET Core app does not show any default file.
- Welcome Page middleware used to display the built in welcome page for root path of asp.net core.
- To Inject Welcome Page Middleware in request pipe line we use extension method called `UseWelcomePage()`

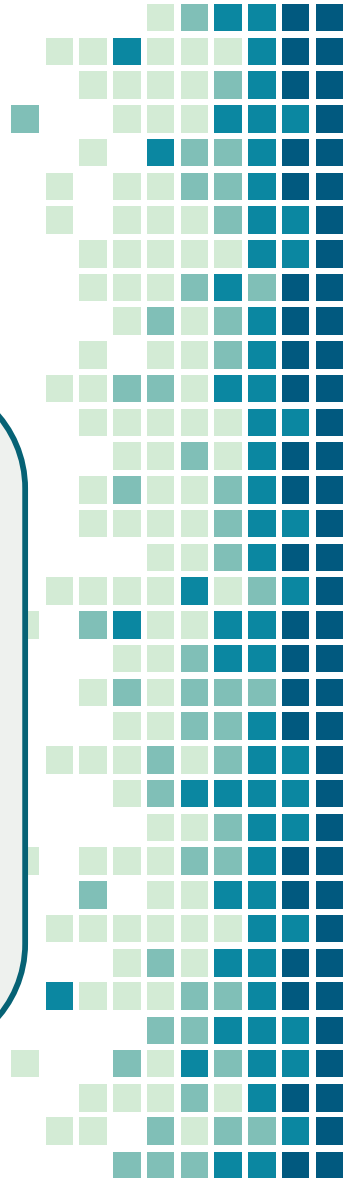

Default Files Middleware

- If you do not want welcome page, if you want to display your html page as default page for root path then we need to use Default Files Middleware.
- For Default files Middleware use extension method `UseDefaultFiles()`. Following are the default files -
 - ❖ Index.html, Index.htm
 - ❖ Default.htm, Default.html

Default Files Middleware

- You can modify the default document using default document options as follows –

```
DefaultFilesOptions options= new  
DefaultFilesOptions();  
options.DefaultFileNames.Clear();  
options.DefaultFileNames.Add("home.html");  
app.UseDefaultFiles(options);
```

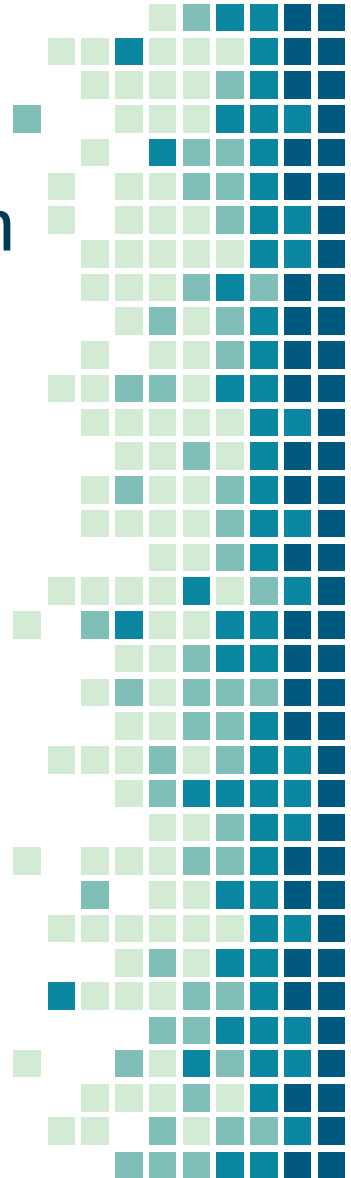

Use File Server Middleware

- Use files middleware is combination of Static Files and Default Files Middleware.
- You can use it using UseFileServer Middleware Extension Method.
- You can also define the options to this middleware using UseFileServerOptions class.

Directory Browser Middleware

- If you want to enable the directory browsing in your application we can use the middle ware.
- For this you can use the extension method `UseDictionaryBrower()`.

THANKS!
